The Infrastructure Layer for  
Real-World Carbon Credits

Tokenising household decarbonisation  
reductions as on-chain carbon credits

Take control of your carbon impact and turn passive credits into a yield-generating digital asset.

# PROBLEM STATEMENT

The voluntary carbon market is undermined by credits that lack verifiable impact, as identified by the UK Government in its Voluntary Carbon Market Integrity Consultation. Greenwashing, double counting and poor traceability make it difficult for corporate buyers to participate with confidence. Traditional carbon credits are static, illiquid assets with no financial utility. They're bought, held and retired off-chain in siloed systems with little transparency or secondary value. This lack of integrity and utility is the single greatest barrier to a market projected to reach \$250 billion by 2050 - if solved.

neutra.

# OUR SOLUTION

We originate new carbon credits directly from verified household decarbonisation. Each credit is backed by emissions reductions from upgrades verified at the point of installation, using standardised, auditable methods. Credits are registered on-chain from creation to retirement, ensuring full traceability and eliminating the risk of double counting. Neutra opens the door to climate-positive DeFi, enabling credits to be staked, pooled or integrated into on-chain financial systems for greater utility and liquidity.

# WHY NOW

neutra.

The UK Government has formally called for greater transparency and traceability in the voluntary carbon market, identifying integrity failures as the biggest obstacle to growth.

Boston Consulting Group projects the voluntary carbon market to be worth \$250 billion by 2050, but only if trust and verifiability can be solved.

UK and EU governments have committed to 600,000+ heat pump installations per year and 30 million home upgrades by 2030, but urgently need scalable ways to encourage and monetise household decarbonisation.

The concept has already been proven off-chain by Snugg, which successfully sold UK residential credits at \$90/tonne. Neutra brings that model on-chain with full lifecycle traceability, automation and DeFi compatibility.

# HOW IT WORKS

neutra.

Step 1: Households install low-carbon technologies such as heat pumps, solar panels, insulation, or batteries.

Step 2: Neutra calculates carbon savings using Verra approved methods.

Step 3: Verified savings are aggregated and tokenised as digital carbon credits.

Step 4: Credits are sold to corporate buyers and households receive cashback based on their verified savings.

Step 5: Households receive cashback for their verified savings which can be staked.

Step 6: Buyers can retire credits or they can be staked for yield, added to liquidity pools, or integrated into finance platforms.

# FORECAST

Metric	Year 1	Year 2	Year 3
Homes Onboarded	100	10,000	100,000
Credits Issued	250	25,000	250,000
Total Credit Value	\$22,500	\$2,250,000	\$22,500,000
Protocol Revenue	\$4,500	\$450,000	\$4,500,000
TVL	\$0	\$300k - \$600k	\$3m - \$5m
On-chain Transactions	1,000	250k - 400k	2.5m - 3m+

On-chain volume driven by real-world impact.

# FUNDING ASK

We are requesting \$65,000 in milestone-based grant funding to build and deploy Neutra's core carbon credit infrastructure on-chain.

## Key Deliverables:

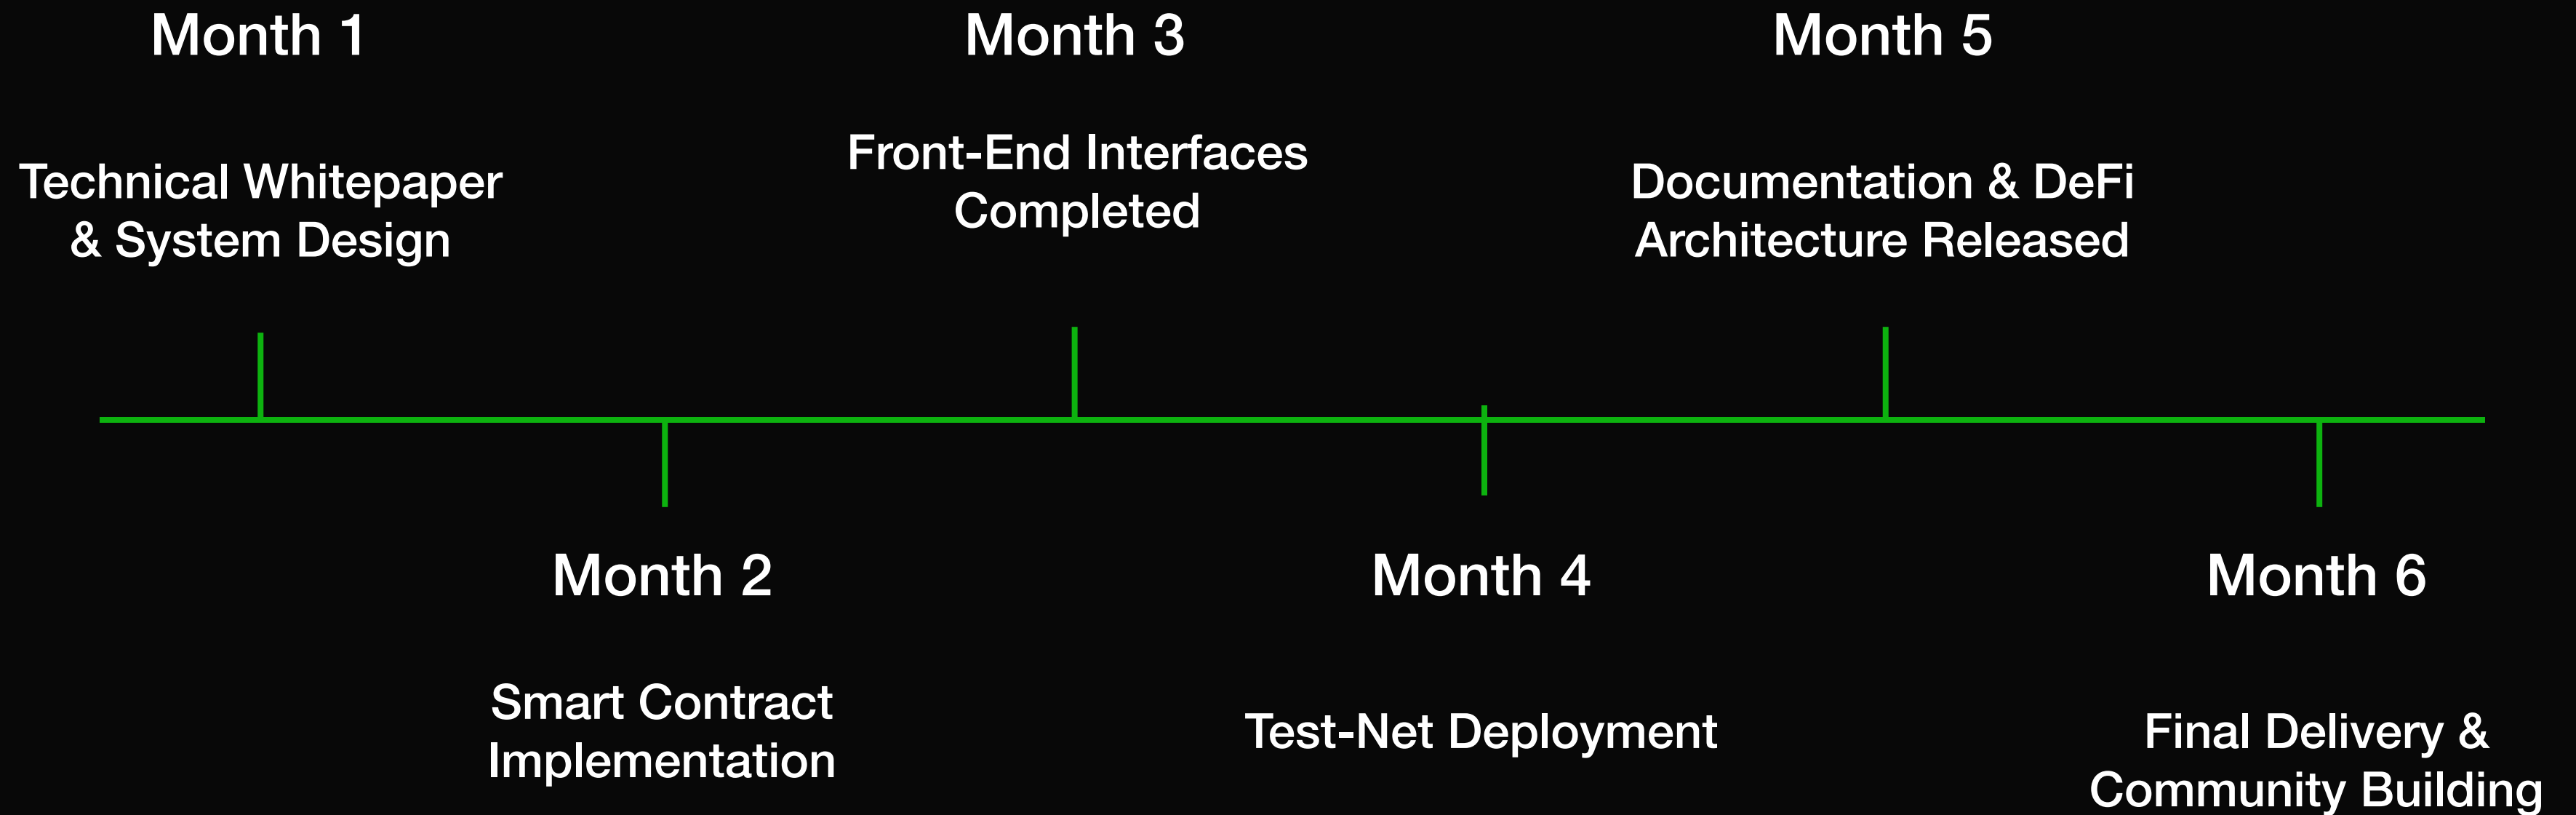

- Core Smart Contracts
- Carbon Verification Engine
- Front-End User Interface
- System Documentation
- Test-net Deployment
- DeFi Architecture
- Public Credit Explorer
- Community Onboarding Materials

Milestone	Objective	Funding
1	System Architecture & Design	\$10,000
2	Smart Contract Development	\$20,000
3	Front-End Interfaces	\$10,000
4	Test-net Integration & Deployment	\$10,000
5	Documentation & DeFi Architecture Spec	\$8,500
6	Final Delivery & Community Building	\$6,500

# ROAD MAP
